SQL queries

Delete

A delete query was written to remove Retro Spectrum from the Artist table (see appendix 31). This deleted the whole row where Artist ID was 42, and due to predefined conditions, the rows where Performance ID was 32 and 50 in the Performance and Schedule tables, and where Schedule ID was 10 (see appendix 32). This demonstrates that if an artist was to drop out of Sunbeat Music Festival, the organiser can remove them easily from the performance line-up and attendee's personal schedules, just by deleting them from the list of artists.

Another delete query was created to remove the Art Gallery from the Non-Musical Event table (see appendix 33). This deleted the whole row where Non-Musical Event ID was 3, and due to predefined conditions, the rows where Event Agenda ID was 23, 36, and 49 in the Event Agenda table (see appendix 34). However, in the Schedule table, the Event Agenda ID 36 was set to null, as Schedule ID 25 can exist without an Event Agenda ID. This indicates that if an event cannot go ahead for unforeseen reasons, the organiser of the festival can remove it from the programme of events and attendee's personal schedule, without dropping their scheduled performance, through deleting it from the list of non-musical events.

A final delete query was designed to remove Ethan Hughes from the Attendee table (see appendix 35). This deleted all the rows where Attendee ID was 4, so due to predefined conditions, this included the rows where Ticket ID was 4 in the Ticket table, and Schedule ID was 5 and 6 in the Schedule table (see appendix 36). This reveals that if an individual wished to no longer attend the festival, the organiser can remove them from the attendee table, along with their allocated ticket and personal schedule they may have created at ease.

Update query

An update query was made to replace Twilight Serenader's second Performance with Post Malogne, change it to the main stage, and to a time of 8:30pm (see appendix 37). This was due to Post Malogne not being in the initial line-up, additionally, they make up for the headliner that was dropped earlier and fill in the gap of time in the line-up. This query altered the row where Performance ID was 49, hence Artist ID changed from 39 to 18, Stage ID from 3 to 1, and Performance Time from 8pm to 8:30pm on the Sunday (see appendix 38). It demonstrates that the organiser of Sunbeat Music Festival can update performance details, such as time, stage, and artist.

Another update query was designed to change Post Malogne's Music Genre and the name of the Stage they were performing on (see appendix 39). This altered the Music Genre where Artist ID was 18 – 'folk, rap, and electronic' to 'folk and lo-fi hip-hop' – and the Stage Name where Stage ID was 1 – 'Main Stage' to 'The Horizon' – due to their association with Performance ID 49 (see appendix 40). Essentially, the Artist table and the Stage table can be altered side by side through their connection in the Performance table. This presents that the organiser can edit artists' profiles alongside updating stage details to perhaps make them appear more enticing or accurate.

Three more update queries were created for the other artists who were not included in the initial line-up to replace another artists' second Performance on the Sunday (see appendices 41 & 43). Performance 51 changed its Artist from Digital Dreams (ID = 40) to The Kill-Joy Division (ID = 25) and the time from 10pm to 9:30pm to bridge the gap in the line-up (see appendix 42). Performance 43 had its Artist changed from Thunder Echoes (ID = 37) to Nine-Inch Snails (ID = 12), and Performance 36 from Harmonic Dusk (ID = 41) to Polar Groove (ID = 32) (see appendix 44). This establishes that the organiser can alter what artist is performing to make sure they are all accommodated for.

Another three update queries were written to alter the times of performances as there were clashes on the Friday (see appendix 45). Lady Baba and Oceanic Drift were both at 3pm, so Performance 6 (Oceanic Drift) was reallocated to 3:30pm. Metalicalica and Echoes of Nowhere were both at 6pm, so Performance 11 (Echoes of Nowhere) was rescheduled to 6:30pm. Finally, Neon Grooves and Harmonic Dusk were both at 9pm, so Performance 16 was changed to 9:30pm (see appendix 46). These queries infer the organiser can alter the times of performances to allow for a smooth-running festival.

Select query

A select query was made to retrieve Event Agenda ID, Name, Type, Day, and Time with Non-Musical Event Name, characterised as Event Location, to illustrate where each Event Agenda will be held (see appendix 47). The table was ordered by Event Agenda ID, so that the events were in chronological order, for example, ID 1 is The Coffee Caravan which is open from 9am every day in the Food and Brew Street, and ID 60 is Oops, Wrong Punchline in the Comedy Tent on Sunday at 9pm (see appendix 48). This establishes that attendees can view the information of what, where, and when the non-musical events for the whole weekend are.

Another select query was created to return Attendee Forename and Surname; Event Agenda Name, Day, and Time; and Event Name, presented as Event Location again, in place of their corresponding IDs in the Schedule table for Attendee 11 (see appendix 49). This showed us Chloe Richardson's personal schedule of events, one of which was Morning Yoga Flow in the Wellness Pavillion at 11am on Friday (see appendix 50). This query demonstrates that an attendee can clearly view their personal schedule they may have made for non-musical events.

A select query was designed to retrieve Performance ID, Day, and Time with Artist Name and Music Genre, and Stage Name, characterised as Performance Location, to illustrate

who is performing and where each Performance is (see appendix 51). The table was ordered by Performance ID, so that performances were in chronological order, for example, the first performance of the weekend was The Rolling Scones on Friday at 12pm bringing classic rock to the headlining stage – The Horizon (see appendix 52). This illustrates that attendees or artists can view the full line-up of performances, including details about the artist and the location they're performing in.

Another select query was written to return Attendee Forename and Surname; Performance Day and Time; and Artist and Stage Name, presented as Performance Location again, in place of their corresponding IDs in the Schedule table for Attendee 27 (see appendix 53). This showed us Charlie Evans' personal schedule of performances, one of which was Chain Smokers Anonymous in the Groove Grounds on Saturday at 7pm (see appendix 54). This query demonstrates that an attendee can clearly view their personal schedule they may have made for their desired artists and performances.

A final select query was created to retrieve data from Attendee Forename and Surname; Ticket ID, Valid From, Valid Till, and Price; Ticket Type VIP and Camping Spot Type, which were ordered alphabetically by attendees' last name, then first name (see appendix 55). This query exhibits that the organiser can locate an attendee's ticket information to ensure they receive the correct tickets or passes for their duration at the festival. For example, Emily Harrison Smith (Ticket ID = 17) has a ticket that is valid for 29/08/2026 – 30/08/2026 (Saturday – Sunday), which includes a VIP Day pass and basic camping, all of which she paid a total of £249.50 for (see appendix 56). This also allows an attendee to review their ticket information; this could be made even simpler by adding a WHERE statement for their Attendee or Ticket ID.

Multi-row functions and grouping data

A query was designed using multi-row functions – Ticket ID count characterised as Tickets Sold and Ticket Price sum as Total Revenue – selecting and grouping the data by Camping Type and Ticket Type (Entry Days and VIP), and ordering it as the number of tickets sold descending followed by the total money the tickets made descending (see appendix 57). The ticket that was most popular (2 sold) and generated the most money (£1010) had Friday, Saturday, and Sunday as Entry Days with premium camping and a Day VIP pass, but the tickets that were least popular (1 sold) and made the least money (£100) were all the singular Entry Days with no camping and no VIP (see appendix 58). This query represents how the organiser of Sunbeat Music Festival can monitor ticket sales and view which ticket combinations are in most demand and which are bringing in the most money for the festival.

Subquery

A query, with a sub query, was written to retrieve Festival Dates and Camping status, with the Total Attendees and Attendee Names associated with them. This was carried out through using a CASE expression to determine the camping status; counting how many attendees have a valid ticket per date; listing the Attendee Names per date; creating a temporary table of Festival Dates; and joining the Ticket to the Festival Date and Attendee to the Ticket (see appendix 59). Additionally, the query grouped results by date and camping status and presented them in date order. The results said there were 10 attendees on 28/08/2026 (Friday) who are meant to be camping, such as Joshua-Phillip Bennet and Amelia Carter (see appendix 60). This demonstrates that the organiser of the festival can monitor how many individuals are attending each day, and how many are staying over each night, which is helpful for planning staffing, security, and crowd flow.

Discussion

This database is a successful management system for Sunbeat Music Festival. It followed closely to the design, with slight alterations to allow the system to run smoothly.

An additional entity was added to the database. It was decided there should be an entity for the happenings of the non-musical events. This should grant attendees to view specific information of the events, what it is and where and when it is taking place, so they can schedule to go if they like. Based on the original ERD, the new entity Event Agenda would be in-between Schedule and Non-Music Event. Essentially, a schedule may save an event agenda, and an event agenda specifies a non-music event. The Event Agenda table contains attributes: Event Agenda ID (INT – 10), Event Agenda Name (VARCHAR – 50), Event Agenda Type (VARCHAR – 75), Event Agenda Day (ENUM – ‘Friday’, ‘Saturday’, ‘Sunday’, ‘Everyday’), Event Agenda Time (TIME), NM Event ID (INT – 10). Also, NM Event ID was replaced with Event Agenda ID in the Schedule table.

When creating the entity tables, many datatypes were altered. All the unique IDs were changed from datatype CHAR to INT. This is because only datatypes with numeric data and defined as a type of integer can operate with auto-increment (Bytebase, 2025), meaning CHAR could not be automatically increased by 1 when new data was added as it contains letters. Entry Days, an attribute of Ticket Type, was originally TINYTEXT, but was swapped for ENUM to present attendees with the different day options when choosing their ticket: ‘Friday’, ‘Saturday’, ‘Sunday’, ‘Friday and Saturday’, ‘Saturday and Sunday’, ‘Friday, Saturday, and Sunday’. Also in Ticket Type, VIP was converted from BOOL to ENUM due to there being two different types of VIP passes available, so the true or false options were not appropriate, but ‘Day’, ‘Weekend’, or NULL are. Event Type, in Non-Musical Event, substituted the datatype TINYTEXT for VARCHAR (30) due to there being a special symbol (dash) in the type of non-musical events the Comedy Tent hosts.

Some field sizes were altered in the entity tables. Where the datatypes ENUM, BOOL, DATE, TIME, and TINYTEXT were present, there was no need for a field size. This is due to them all already having set lengths, whether this is predetermined – BOOL (1 or 0), DATE (YYYY/MM/DD), TIME (HH:MM:SS), TINYTEXT (255 characters) – or determined by the options provided – ENUM (‘value 1’, ‘value 2’...) (W3schools, 2025). Moreover, the field size of Price in the Ticket table was changed to 6,2 as a DECIMAL field type should be presented as ‘total length’, ‘length after decimal’ not just total length (W3schools, 2025b).

There were additions and deletions of attributes throughout the build. The table Stage was given Stage Type (TINYTEXT) as an attribute to describe what kind of artists and music will be being performed on a stage. For Performance, Performance Day (ENUM – ‘Friday’, ‘Saturday’, ‘Sunday’) and Performance Time (TIME) were added to present when a performance will be. However, Performance Type was removed as it would have been repeating the same/very similar information as Music Genre in Artist, which could have led to prodical storage, data integrity issues, and defective query results (Zanini, 2025). In Schedule, Priority Level appeared redundant and was no longer needed as attendees would not add a performance or event to their personal schedule if it was not a high priority.

When inserting data into the tables, it was ensured all tables were filled with a sufficient amount of data. Non-Musical Event had 7 required rows of data, Stage had 5, Artist had 42, Performance had 51, Ticket Type had 13, and Camping Spot had 2 (see appendices 11-16). Attendee had 40 devised rows of data, Event Agenda had 60, Ticket had 40, and Schedule had 30 (see appendices 12-15). It should be noted that Sunbeat Music Festival was established to be on August Bank Holiday weekend 2026, meaning the dates the tickets could be valid for are ‘2026/08/28’, ‘2026/08/29’, and ‘2026/08/30’. Additionally, the data for Performance and Event Agenda were inserted in chronological order, so it was clear and flowed pleasantly.

Through the creation of entity tables, insertion of data into them, and application of appropriate queries, this festival database management system meets the requirements. It demonstrates the attendee can book tickets and reserve an optional camping spot, and a summary of their booking can be accessed by themselves and the organiser. An attendee and artist can view the line-up of performances, which an attendee can create a personalised schedule from. The attendee can view information on non-musical events if they would like to schedule that also. Furthermore, the organiser of Sunbeat Music Festival can update the line-up of performances and profiles of the artists. They can also monitor daily attendances and sales of different ticket types to analyse financial performance.
